 SUMMARY LANGUAGE: English

AB Various plant isoprenoids are synthesized via the non-mevalonate pathway of isopentenyl diphosphate formation. In this pathway, 1-deoxy-D-**xylulose** 5-phosphate (DOXP), the first intermediate, is transformed to 2-C-methyl-D-erythritol 4-phosphate (MEP) by an enzyme which was recently cloned from *Escherichia coli*. In order to find a plant homologue of this 1-deoxy-D-**xylulose** 5-phosphate **reductoisomerase** (DXR) we cloned a cDNA fragment from **Arabidopsis thaliana** which has high homology to the *E. coli* DXR. By expression of this fragment in *E. coli* we could demonstrate that it encodes a protein which transforms DOXP to MEP. The antibiotic fosmidomycin specifically inhibits this DXR enzyme activity.
